

1  
**MODULATOR**

The present invention relates to compounds capable of modulating cannabinoid receptors.

5

**BACKGROUND TO THE INVENTION**

There has recently been renewed interest in the therapeutic uses of medical cannabis and synthetic cannabinoids, such as  $\Delta^9$ -tetrahydrocannabinol (THC) [1], the active component of cannabis.

[1]  $\Delta^9$ -THC

10

THC may be therapeutically beneficial in several major areas of medicine including control of acute and in particular chronic/neuropathic pain, nausea, anorexia, AIDS, glaucoma, asthma and in multiple sclerosis [Baker, D. *et al*, *Nature* 2000, 404, 84-87; Baker, D. *et al*, *FASEB J.* 2001, 15, 300-302; Schnelle, M. *et al*, *Forsch. Komplementarmed.* 1999, 6 Suppl 3, 28-36].

A number of cannabinoid ligands have been reported in the literature. Broadly speaking, cannabinoid ligands may be divided into three main groups consisting of (i) classical cannabinoids, such as (-)- $\Delta^9$ -tetrahydrocannabinol,  $\Delta^9$ -THC [1] and CP55,940 [9]; (ii) endocannabinoids, such as anandamide [2] and 2-arachidonoyl glycerol [3]; and (iii) non-classical heterocyclic analogues typified by heterocycles such as WIN 55,212 [7] and the selective CB<sub>1</sub> antagonist SR141716A [8] [Pertwee, R. G., *Pharmacology & Therapeutics* 1997, 74, 129-180]. Conformationally restricted anandamide analogues have also been reported [Berglund, B. A. *et al*, *Drug Design and Discovery* 2000, 16, 281-294]. To date, however, the therapeutic usefulness of cannabinoid drugs has been limited by their undesirable psychoactive properties.

Cannabinoids are known to modulate nociceptive processing in models of acute, inflammatory and neuropathic pain [Pertwee, R. G., *Prog. Neurobiol.* 2001, 63, 569-611]. More specifically, research has centred on the role of cannabinoids in models of neuropathic hyperalgesia [Herzberg, U. *et al*, *Neurosci. Lett.* 1997, 221, 157-160] and inflammatory hyperalgesia [Richardson, J. D., *Pain* 1998, 75, 111-119; Jaggar, S. I. *et al*, *Pain* 1998, 76, 189-199; Calignano, A. *et al*, *Nature* 1998, 394, 277-281; Hanus, L. *et al*, *Proc. Natl. Acad. Sci. U. S. A* 1999, 96, 14228-14233]. It has also been suggested that cannabinoid receptor expression and the level of endogenous cannabinoids may change during inflammation and hyperalgesia [Pertwee, R. G., *Prog. Neurobiol.* 2001, 63, 569-611].

The cannabinoid signaling system is thought to involve two cloned cannabinoid receptors (CB<sub>1</sub> and CB<sub>2</sub>), endocannabinoid ligands such as anandamide [2] and 2-arachidonoyl glycerol [3], and an endocannabinoid degradation system [Howlett, A. C. *et al*, International Union of Pharmacology XXVII, *Pharmacol. Rev.* 2002, 54, 161-202; Pertwee, R. G., Pharmacology of cannabinoid receptor ligands. *Curr. Med. Chem.* 1999, 6, 635-664].

One important function of the cannabinoid system is to act as a regulator of synaptic neurotransmitter release [Kreitzer, A. C. *et al*, *Neuron* 2001, 29, 717-727; Wilson, R. I. *et al*, *Neuron* 2001, 31, 453-462]. CB<sub>1</sub> is expressed at high levels in the CNS, notably the globus pallidus, substantia nigra, cerebellum and hippocampus [Howlett, A. C.,  
5 *Neurobiol. Dis.* 1998, 5, 405-416]. This is consistent with the known adverse effects of cannabis on balance and short-term memory processing [Howlett, A. C. *et al*, International Union of Pharmacology XXVII, *Pharmacol. Rev.* 2002, 54, 161-202]. CB<sub>2</sub> is expressed by leucocytes and its modulation does not elicit psychoactive effects; moreover it does not represent a significant target for symptom management where the  
10 majority of effects are CB<sub>1</sub> mediated.

Although many cannabinoid effects are centrally-mediated by receptors in the CNS [Howlett, A. C. *et al*, International Union of Pharmacology XXVII, *Pharmacol. Rev.* 2002, 54, 161-202], it is understood that peripheral CB receptors also play an important  
15 role, particularly in pain and in the gastrointestinal tract. For example, CB<sub>1</sub> is also expressed in peripheral tissues, such as in dorsal root ganglia, peripheral nerves and neuromuscular terminals, thereby allowing neurotransmission to be regulated outside the CNS [Pertwee, R. G., *Life Sci.* 1999, 65, 597-605]. Accordingly, therapeutic activity in conditions such as those involving pain [Fox, A. *et al*, *Pain* 2001, 92, 91-  
20 100] or gut hypermotility, may be located in non-CNS sites. To date, however, research into the peripheral cannabinoid system has been hampered by the lack of pharmacological agents that selectively target peripheral receptors over those of the CNS.

25 In order to eliminate adverse psychoactive effects, it is desirable to exclude cannabinoid agonists from the CNS. There are two established methods for CNS exclusion of small molecule agents. Firstly, one method involves excluding substances from the CNS by carefully controlling their physicochemical properties so as to prevent them crossing the blood brain barrier (BBB). The BBB is formed by brain endothelial  
30 cells, with tight intercellular junctions and little fenestration [Tamai, I. *et al*, *J. Pharm. Sci.* 2000, 89, 1371-1388]. Consequently, substances must enter the brain either by

passive diffusion across plasma membranes or by active transport mechanisms. The BBB thus forms an effective barrier to many peripherally circulating substances.

An alternative method of excluding compounds from the brain is to incorporate structural features which enable them to be actively pumped across the BBB. One such example is the opioid agonist loperamide; although lipophilic, loperamide contains structural features recognized by the p-glycoprotein transporter (MDR1) that allow it to be actively pumped across the blood brain barrier. [Wandel, C. *et al*, *Anesthesiology* 2002, 96, 913-920; Seelig, A. *et al*, *Eur. J. Pharm. Sci.* 2000; 12, 31-40].

10

The present invention seeks to provide new cannabinoid receptor modulators. More particularly, the invention seeks to provide cannabinoid receptor modulators that alleviate and/or eliminate some of the disadvantages commonly associated with prior art modulators, for example undesirable psychoactive side effects. More specifically, though not exclusively, the invention seeks to provide modulators that selectively target peripheral cannabinoid receptors.

15

## STATEMENT OF INVENTION

A first aspect of the invention relates to a compound of formula I, or a pharmaceutically acceptable salt thereof,

20

wherein

Z is  $OR^1$  or  $NR^1R^2$  wherein each of  $R^1$  and  $R^2$  is independently H, or a hydrocarbyl group;

25

5

X is an alkylene, alkenylene, or alkynylene group, each of which may be optionally substituted by one or more substituents selected from alkyl, COOH, CO<sub>2</sub>-alkyl, alkenyl, CN, NH<sub>2</sub>, hydroxy, halo, alkoxy, CF<sub>3</sub> and nitro;

Y is a polar functional group selected from OH, NO<sub>2</sub>, CN, COR<sup>3</sup>, COOR<sup>3</sup>, NR<sup>3</sup>R<sup>4</sup>,  
5 CONR<sup>3</sup>R<sup>4</sup>, SO<sub>3</sub>H, SO<sub>2</sub>-R<sup>3</sup>, SO<sub>2</sub>NR<sup>3</sup>R<sup>4</sup> and CF<sub>3</sub>, where each of R<sup>3</sup> and R<sup>4</sup> is independently H or a hydrocarbyl group;

A is an aryl or heteroaryl group, each of which may be optionally substituted; and

B is (CH<sub>2</sub>)<sub>n</sub> where n is 0, 1, 2, 3, 4 or 5;

with the proviso that:

- 10 (i) when A is phenyl, n is 0, and Z is OH, X-Y is other than *meta*-C≡C-(CH<sub>2</sub>)<sub>2</sub>CO<sub>2</sub>H, *meta*-C≡C-(CH<sub>2</sub>)<sub>2</sub>OH, *meta*-C≡C-(CH<sub>2</sub>)<sub>2</sub>CO<sub>2</sub>Me, *meta*-(CH<sub>2</sub>)<sub>4</sub>CO<sub>2</sub>H, *ortho*-CH<sub>2</sub>CO<sub>2</sub>H, *ortho*-(CH<sub>2</sub>)<sub>2</sub>CO<sub>2</sub>H and *ortho*-(CH<sub>2</sub>)<sub>4</sub>CO<sub>2</sub>H; and  
(ii) when A is phenyl, n is 0, and Z is OMe, X-Y is other than *meta*-C≡C-(CH<sub>2</sub>)<sub>4</sub>OH.

15

Advantageously, the compounds of the present invention preferably exhibit improved aqueous solubility and/or decreased lipophilicity compared to prior art cannabinoid receptor modulators.

- 20 A second aspect of the invention relates to the use of a compound of formula Ia, or a pharmaceutically acceptable salt thereof,

25 wherein

Z is OR<sup>1</sup> or NR<sup>1</sup>R<sup>2</sup> wherein each of R<sup>1</sup> and R<sup>2</sup> is independently H, or a hydrocarbyl group;

6

X is an alkylene, alkenylene, or alkynylene group, each of which may be optionally substituted;

Y is a polar functional group;

A is an aryl or heteroaryl group, each of which may be optionally substituted; and

5 B is  $(\text{CH}_2)_n$  where n is 0, 1, 2, 3, 4 or 5.

in the preparation of a medicament for treating a muscular disorder.

A third aspect of the invention relates to the use of a compound of formula Ia, or a pharmaceutically acceptable salt thereof, as defined above in the preparation of a  
10 medicament for controlling spasticity and tremors.

A fourth aspect of the invention relates to the use of a compound of formula Ia, or a pharmaceutically acceptable salt thereof, as defined above in the preparation of a medicament for treating a gastrointestinal disorder.

15

A fifth aspect of the invention relates to a pharmaceutical composition comprising a compound of formula I as defined above admixed with a pharmaceutically acceptable diluent, excipient or carrier.

20 A sixth aspect of the invention relates to the use of a compound of formula Ia, or a pharmaceutically acceptable salt thereof, in an assay for identifying further compounds capable of modulating cannabinoid receptor activity.

## DETAILED DESCRIPTION

25

### CANNABINOID

A cannabinoid is an entity that is capable of binding to a cannabinoid receptor, in particular CB1 and/or CB2. Typical cannabinoids include the 30 or so derivatives of 2-(2-isopropyl-5-methylphenyl)-5-pentylresorcinol that are found in the Indian hemp,  
30 *Cannabis sativa*, among which are those responsible for the narcotic actions of the plant and its extracts. Examples of cannabinoids are cannabidiol, cannabinol, *trans*- $\Delta^9$ -tetrahydrocannabinol, *trans*- $\Delta^8$ -tetrahydrocannabinol, and  $\Delta^9$ -tetrahydro-cannabinolic

acid. Other examples of cannabinoids include anandamide, methanandamide and R(+)WIN55,212.

### ENDOCANNABINOID

5 This term means a cannabinoid that exists naturally in the body – as opposed to an exogeneously supplied cannabinoid. Endocannabinoids are discussed by Di Marzo (1998) *Biochimica et Biophysica Acta* vol 1392 pages 153-175 (the contents of which are incorporated herein by reference). An example of an endocannabinoid is anandamide. Teachings on this entity and anandamide amidase may be found in US-A-  
10 5874459. This document teaches the use of anandamide amidase inhibitors as analgesic agents.

### CANNABINOID RECEPTOR

A cannabinoid receptor is any one or more of several membrane proteins that bind  
15 cannabinol and structurally similar compounds and mediate their intracellular action.

Two receptors for the psychoactive ingredient of marijuana  $\Delta^9$ -tetrahydrocannabinol (THC), the CB<sub>1</sub> and CB<sub>2</sub> cannabinoid receptors, have been found (Pertwee 1997 *Pharmacol Ther* vol 74 129-180). Both of these receptors are seven-transmembrane-  
20 domain G-protein-coupled receptors. CB<sub>1</sub> receptors are found in the brain and testis. CB<sub>2</sub> receptors are found in the spleen and not in the brain.

For both types of receptor arachidonylethanolamide (anandamide) is a putative endogenous ligand and both types are negatively coupled to adenylate cyclase  
25 decreasing intracellular cyclic AMP levels. Examples of sequences for such receptors are from *Mus musculus* – and include: CB<sub>1</sub>, database code CB1R\_MOUSE, 473 amino acids (52.94 kDa); CB<sub>2</sub>, database code CB2R\_MOUSE, 347 amino acids (38.21 kDa). More details on CB<sub>1</sub> and CB<sub>2</sub> now follow.

### 30 CANNABINOID RECEPTOR 1 (CB<sub>1</sub> or CNR1)

Background teachings on CB<sub>1</sub> have been presented by Victor A. McKusick *et al* on <http://www.ncbi.nlm.nih.gov/Omim>. The following information concerning CB<sub>1</sub> has

been extracted from that source.

The cannabinoids are psychoactive ingredients of marijuana, principally delta-9-tetrahydrocannabinol, as well as the synthetic analogs Matsuda et al [*Nature* 346: 561-564, 1990] cloned a cannabinoid receptor from a rat brain. Using a cosmid clone of the entire coding sequence of the human gene, Modi and Bonner [Abstract, *Cytogenet. Cell Genet.* 58: 1915 only, 1991] mapped the human CNR locus to 6q14-q15 by in situ hybridization. Gerard et al. [*Biochem. J.* 279: 129-134, 1991] isolated a cDNA encoding a cannabinoid receptor from a human brain stem cDNA library. The deduced amino acid sequence encoded a protein of 472 residues which shared 97.3% identity with the rat cannabinoid receptor cloned by Matsuda et al [*ibid*, 1990]. They provided evidence for the existence of an identical cannabinoid receptor expressed in human testis. Hoehe et al [*New Biologist* 3: 880-885, 1991] determined the genomic localization of the CNR gene by combination of genetic linkage mapping and chromosomal in situ hybridization. Close linkage was suggested with CGA which is located at 6q21.1-q23; maximum lod = 2.71 at theta = 0.0. Moreover, CNR was linked to markers that define locus D6Z1, a sequence localized exclusively to centromeres of all chromosomes and enriched on chromosome 6. Ledent et al [*Science* 283: 401-404, 1999] investigated the function of the central cannabinoid receptor (CB1) by disrupting the gene in mice. Mutant mice did not respond to cannabinoid drugs, demonstrating the exclusive role of CB1 in mediating analgesia, reinforcement, hypothermia, hypolocomotion, and hypotension.

### **CANNABINOID RECEPTOR 2 (CB2 or CNR2)**

Background teachings on CB2 have been presented by Victor A. McKusick *et al* on <http://www.ncbi.nlm.nih.gov/Omim>. The following information concerning CB2 has been extracted from that source.

In addition to its renowned psychoactive properties, marijuana, or its major active cannabinoid ingredient, delta-9-tetrahydrocannabinol, exerts analgesic, antiinflammatory, immunosuppressive, anticonvulsive, and antiemetic effects as well as the alleviation of intraocular pressure in glaucoma. The G protein-coupled cannabinoid

receptor-1 (CNR1; 114610), which is expressed in brain but not in the periphery, apart from low levels in testis, does not readily account for the nonpsychoactive effects of cannabinoids.

5 Using PCR with degenerate primers to screen a promyelocytic leukemia cell cDNA library [Munro, *Nature* 365: 61-65, 1993] obtained a cDNA encoding CNR2, which the authors called CX5. Sequence analysis predicted that the deduced 360-amino acid 7-transmembrane-spanning protein has 44% amino acid identity with CNR1 overall and 68% identity with the transmembrane residues proposed to confer ligand specificity.

10 Binding analysis determined that CNR2 encodes a high-affinity receptor for cannabinoids, with higher affinity than CNR1 for cannabinol. Northern blot analysis revealed that the expression of 2.5- and 5.0-kb transcripts in the HL60 myeloid cell line increases on myeloid, or granulocyte, differentiation. Using the rat CX5 homolog, Munro [1993, *ibid*] found that the 2.5-kb transcript is expressed in spleen but not in

15 brain, kidney, lung, thymus, liver, or nasal epithelium. In situ hybridization analysis demonstrated expression in splenic marginal zones. PCR analysis detected CNR2 expression in purified splenic macrophages but not in CD5+ T cells. Munro [1993, *ibid*] speculated that the location of CNR2 suggests that its endogenous ligand should have an immunomodulatory role. The International Radiation Hybrid Mapping

20 Consortium mapped the CNR2 gene to chromosome (stSG90).

## COMPOUNDS

As mentioned hereinabove, the compounds of the present invention preferably exhibit improved aqueous solubility and/or decreased lipophilicity compared to prior art

25 cannabinoid modulators. Preferably, the compounds of the invention do not cross the blood-brain barrier to any substantial extent.

The present invention relates to compounds of formula I, Ia, Ib and Ic as defined herein.

30

As used herein, the term "hydrocarbyl" refers to a group comprising at least C and H that may optionally comprise one or more other suitable substituents. Examples of such

substituents may include hydroxy, halo-, alkoxy-, nitro-, an alkyl group, or a cyclic group. In addition to the possibility of the substituents being a cyclic group, a combination of substituents may form a cyclic group. If the hydrocarbyl group comprises more than one C then those carbons need not necessarily be linked to each other. For example, at least two of the carbons may be linked via a suitable element or group. Thus, the hydrocarbyl group may contain heteroatoms. Suitable heteroatoms will be apparent to those skilled in the art and include, for instance, sulphur, nitrogen, oxygen, phosphorus and silicon. Preferably, the hydrocarbyl group is an alkyl group, an alkenyl, group, an aryl group, or a cycloalkyl group, each of which may be optionally substituted. More preferably, the hydrocarbyl group is alkyl, alkenyl, cycloalkyl or phenyl.

As used herein, the term "alkyl" includes both saturated straight chain and branched alkyl groups which may be substituted (mono- or poly-) or unsubstituted. Preferably, the alkyl group is a C<sub>1-20</sub> alkyl group, more preferably a C<sub>1-15</sub>, more preferably still a C<sub>1-10</sub> alkyl group, more preferably still, a C<sub>1-6</sub> alkyl group. Particularly preferred alkyl groups include, for example, methyl, ethyl, propyl, isopropyl, butyl, isobutyl, tert-butyl, pentyl and hexyl. Suitable substituents include, for example, alkyl, hydroxy, halo-, alkoxy-, nitro-, COOH, CO<sub>2</sub>-alkyl, alkenyl, CN, NH<sub>2</sub>, CF<sub>3</sub> or a cyclic group. The skilled person will appreciate that the term "alkylene" is construed accordingly, i.e. in the context of the present invention, the term "alkylene" encompasses a straight or branched, substituted (mono- or poly-) or unsubstituted saturated carbon chain bearing a terminal Y group.

As used herein, the term "cycloalkyl" refers to a cyclic alkyl group which may be substituted (mono- or poly-) or unsubstituted. Suitable substituents include, for example, alkyl, hydroxy, halo-, alkoxy-, nitro-, COOH, CO<sub>2</sub>-alkyl, alkenyl, CN, NH<sub>2</sub>, CF<sub>3</sub> or a cyclic group.

As used herein, the term "alkenyl" refers to group containing one or more double bonds, which may be branched or unbranched, and substituted (mono- or poly-) or unsubstituted. Preferably the alkenyl group is a C<sub>2-20</sub> alkenyl group, more preferably a

C<sub>2-15</sub> alkenyl group, more preferably still a C<sub>2-10</sub> alkenyl group, or preferably a C<sub>2-6</sub> alkenyl group. Suitable substituents include, for example, alkyl, hydroxy, halo-, alkoxy-, nitro-, COOH, CO<sub>2</sub>-alkyl, alkenyl, CN, NH<sub>2</sub>, CF<sub>3</sub> or a cyclic group. The skilled person will appreciate that the term "alkenylene" is construed accordingly, i.e. in the context of the present invention, the term "alkenylene" encompasses a straight or branched, substituted (mono- or poly-) or unsubstituted unsaturated carbon chain containing one or more double bonds and bearing a terminal Y group.

As used herein, the term "alkynyl" refers to a group containing one or more triple bonds, which may be branched or unbranched, and substituted (mono- or poly-) or unsubstituted. Preferably the alkynyl group is a C<sub>2-20</sub> alkynyl group, more preferably a C<sub>2-15</sub> alkynyl group, more preferably still a C<sub>2-10</sub> alkynyl group, or preferably a C<sub>2-6</sub> alkynyl group. Suitable substituents include, for example, alkyl, hydroxy, halo-, alkoxy-, nitro-, COOH, CO<sub>2</sub>-alkyl, alkenyl, CN, NH<sub>2</sub>, CF<sub>3</sub> or a cyclic group. The skilled person will appreciate that the term "alkynylene" is construed accordingly, i.e. in the context of the present invention, the term "alkynylene" encompasses a straight or branched, substituted (mono- or poly-) or unsubstituted unsaturated carbon chain containing one or more triple bonds and bearing a terminal Y group.

As used herein, the term "aryl" refers to a C<sub>6-10</sub> aromatic group which may be substituted (mono- or poly-) or unsubstituted. Typical examples include phenyl and naphthyl etc. Suitable substituents include, for example, alkyl, hydroxy, halo-, alkoxy-, nitro-, COOH, CO<sub>2</sub>-alkyl, alkenyl, CN, NH<sub>2</sub>, CF<sub>3</sub> or a cyclic group.

The term "heteroaryl" refers to an aryl group as defined above which contains one or more heteroatoms. Suitable heteroatoms will be apparent to those skilled in the art and include, for example, sulphur, nitrogen, oxygen, phosphorus and silicon. Suitable substituents include, for example, alkyl, hydroxy, halo-, alkoxy-, nitro-, COOH, CO<sub>2</sub>-alkyl, alkenyl, CN, NH<sub>2</sub>, CF<sub>3</sub> or a cyclic group.

30

The compounds of formula Ia (for use in the present invention) contain a polar functional group Y, which is attached to the aryl group, A, by means of a saturated or

unsaturated hydrocarbyl linker group X. Suitable polar functional groups will be familiar to those skilled in the art and include, for example, any functional group which comprises one or more electronegative atoms, such as F, O, N, Cl or Br etc. Preferred polar functional groups include hydroxy, alkoxy, amine, imine, nitro, cyano, carbonyl-  
5 containing groups and sulfoxy-containing groups.

For compounds of formula Ia, especially preferred polar groups include  $\text{NO}_2$ ,  $\text{CN}$ ,  $\text{OR}^3$ ,  $\text{COR}^3$ ,  $\text{COOR}^3$ ,  $\text{NR}^3\text{R}^4$ ,  $\text{CONR}^3\text{R}^4$ ,  $\text{SO}_3\text{H}$ ,  $\text{SO}_2\text{R}^3$ ,  $\text{SO}_2\text{NR}^3\text{R}^4$  and  $\text{CF}_3$ , where each of  $\text{R}^3$  and  $\text{R}^4$  is independently H or a hydrocarbyl group.

10

For compounds of formula Ia, in one particularly preferred embodiment, Y is selected from  $\text{OR}^3$ ,  $\text{CN}$ ,  $\text{COOR}^3$ ,  $\text{SO}_2\text{NR}^3\text{R}^4$ ,  $\text{CONR}^3\text{R}^4$ , where each of  $\text{R}^3$  and  $\text{R}^4$  is independently H or a hydrocarbyl group.

15 For compounds of formula Ia, in an even more preferred embodiment of the invention, Y is selected from  $\text{OR}^3$ ,  $\text{CN}$ ,  $\text{COOR}^3$ ,  $\text{CONR}^3\text{R}^4$ , where each of  $\text{R}^3$  and  $\text{R}^4$  is independently H or an alkyl group optionally substituted by one or more substituents selected from hydroxy, halo-, alkoxy-, nitro-, and a cyclic group.

20 For compounds of formula Ia, more preferably still, Y is selected from OH, CN, COOMe, COOH,  $\text{CONH}_2$ , CONHMe and  $\text{CONMe}_2$ .

For compounds of formula I, the polar group Y is selected from  $\text{NO}_2$ , OH, CN,  $\text{COR}^3$ ,  $\text{COOR}^3$ ,  $\text{NR}^3\text{R}^4$ ,  $\text{CONR}^3\text{R}^4$ ,  $\text{SO}_3\text{H}$ ,  $\text{SO}_2\text{-R}^3$ ,  $\text{SO}_2\text{NR}^3\text{R}^4$  and  $\text{CF}_3$ , where each of  $\text{R}^3$  and  
25  $\text{R}^4$  is independently H or a hydrocarbyl group.

For compounds of formula I, preferably polar group Y is selected from, OH, CN,  $\text{COOR}^3$ ,  $\text{SO}_2\text{NR}^3\text{R}^4$ ,  $\text{CONR}^3\text{R}^4$ , where each of  $\text{R}^3$  and  $\text{R}^4$  is independently H or a hydrocarbyl group.

30

For compounds of formula I, in an even more preferred embodiment of the invention, Y is selected from OH, CN,  $\text{COOR}^3$ ,  $\text{CONR}^3\text{R}^4$ , where each of  $\text{R}^3$  and  $\text{R}^4$  is

13

independently H or an alkyl group optionally substituted by one or more substituents selected from hydroxy, halo-, alkoxy-, nitro-, and a cyclic group.

For compounds of formula I, more preferably still, Y is selected from OH, CN,  
5 COOMe, COOH, CONH<sub>2</sub>, CONHMe and CONMe<sub>2</sub>.

For all the above embodiments, preferably each of R<sup>1</sup>, R<sup>2</sup>, R<sup>3</sup> and R<sup>4</sup> is independently H, an alkyl group, an aryl group, or a cycloalkyl group, each of which may be optionally substituted by one or more substituents selected from hydroxy, halo-,  
10 alkoxy-, nitro-, and a cyclic group.

In one particularly preferred embodiment of the invention, n is 0; i.e., B is absent and the -C(=O)Z moiety is attached directly to aryl group, A.

15 For compounds of formula I and Ia, preferably, X-Y is selected from

where each of R<sup>5</sup>, R<sup>6</sup>, R<sup>7</sup> and R<sup>8</sup> is independently H or alkyl, and each of p, q  
20 and r is independently 1 to 6, more preferably, 2, 3, or 4.

For compounds of formula I and Ia, even more preferably, X-Y is selected from

25 where each of p and q is independently 1 to 6, more preferably 2, 3, or 4.

In one preferred embodiment, R<sup>5</sup> and R<sup>6</sup> are both H.

For compounds of formula I and Ia, in one especially preferred embodiment, X-Y is

For compounds of formula I and Ia, in another preferred embodiment, X-Y is

14

$-\text{C}(\text{Me})_2-\text{CH}_2-(\text{CH}_2)_r-\text{Y}$  and  $r$  is 1 to 6, more preferably, 2, 3 or 4.

In another preferred embodiment,  $\text{X}-\text{Y}$  is  $(\text{CH}_2)_s-\text{Y}$  where  $s$  is 1 to 6, more preferably, 2, 3, 4 or 5.

5

Preferably, for compounds of formula I and Ia, A is an optionally substituted phenyl or pyridyl group, more preferably a phenyl group.

In another preferred embodiment, A is an unsubstituted phenyl or pyridyl group, more preferably an unsubstituted phenyl group.

10

In one particularly preferred embodiment, said compound is of formula Ib

15

wherein A, B, X, Y and Z are as defined above.

In another particularly preferred embodiment, said compound is of formula Ic

20

wherein A, B, X, Y and Z are as defined above.

15

Preferably, Z is OR<sup>1</sup> or NR<sup>1</sup>R<sup>2</sup> and each of R<sup>1</sup> and R<sup>2</sup> is independently H, an alkyl or a cycloalkyl group, each of which may be optionally substituted by one or more OH or halogen groups.

- 5 In one preferred embodiment, Z is NR<sup>1</sup>R<sup>2</sup> and each of R<sup>1</sup> and R<sup>2</sup> is independently H or an alkyl or a cycloalkyl group, each of which may be optionally substituted by one or more OH or halogen groups.

10 In one preferred embodiment, Z is OR<sup>1</sup> and R<sup>1</sup> is an alkyl or a cycloalkyl group, each of which may be optionally substituted by one or more OH or halogen groups.

In one preferred embodiment, Z is selected from OH, OEt, NHCH<sub>2</sub>CH<sub>2</sub>F, NH-cyclopropyl, NHCH(Me)CH<sub>2</sub>OH and NHCH<sub>2</sub>CH<sub>2</sub>OH.

- 15 In a more preferred embodiment, Z is selected from OEt, NHCH<sub>2</sub>CH<sub>2</sub>F, NH-cyclopropyl, NHCH(Me)CH<sub>2</sub>OH and NHCH<sub>2</sub>CH<sub>2</sub>OH.

20 The compounds of the invention were investigated for cannabinoid receptor binding and activation *in vitro* and for psychoactive potential *in vivo*, using mice. CNS levels were quantified using direct measurement of compound brain levels (for compounds lacking CNS effects). Peripheral cannabinoid activation was assessed using gut motility assays. Further details of the binding studies may be found in the accompanying Examples section.

- 25 Especially preferred compounds of the invention are selected from the following:

16

More preferably still, the compound of formula I is:

Advantageously, compound (16) was shown to modulate peripheral cannabinoid  
 5 receptors without producing substantial CNS effects. Moreover, experiments carried  
 out on CREAE mice suggest that compound (16) is capable of achieving selective  
 inhibition of spasticity without producing CNS effects.

In an even more preferred embodiment, compound (16) is in the form of a racemic  
 10 mixture.

## SYNTHESIS

Compounds of formula I and Ia are synthesised in accordance with Scheme 1 below.

**Scheme 1**

In brief, a palladium catalysed Sonogashira coupling reaction was used to insert a variety  
 of alkyl side chains into 3-iodo methyl benzoate. The target compounds (S5) and

related analogues were synthesised by a simple four-step route. First, the acid (S1) was reacted with DL alaninol in the presence of a diimide (EDCI) to give the amide (S2) in good yield. Palladium-catalysed coupling [Hoye, R. C. *et al*, *J. Org. Chem.* 1999, 64, 2450-2453; Hopper, A. T. *et al*, *J. Med. Chem.* 1998, 41, 420-427] of the amide with the alkyne acid in the presence of Cu<sup>I</sup> and pyrrolidine proceeded smoothly to give the alkyne (S3). The acid (S3) was quantitatively transformed into (S4) using ethylchloroformate and dimethylamine HCl. Lindlar catalysed reduction yielded the target alkene (S5). The flexibility of this method allows the synthesis of a large number of different compounds using a range of alkynes for the Sonogashira coupling, or by starting with a different amine for the amide formation in the first step.

### THERAPEUTIC APPLICATIONS

Another aspect relates to the use of a compound of formula Ia according to the invention in the preparation of a medicament for treating a muscular disorder. Preferred embodiments are identical to those set forth above for compounds of general formula I.

Preferably, the muscular disorder is a neuromuscular disorder.

As used herein the phrase "preparation of a medicament" includes the use of a compound of formula I directly as the medicament in addition to its use in a screening programme for further agents or in any stage of the manufacture of such a medicament.

The term "muscular disorder" is used in a broad sense to cover any muscular disorder or disease, in particular a neurological disorder or disease, more particularly, a neurodegenerative disease or an adverse condition involving neuromuscular control. Thus, the term includes, for example, CREAE, MS, spasticity, Parkinson's disease, Huntingdon's Chorea, spinal cord injury, epilepsy, Tourettes' syndrome, and bladder spasm. Although there is no clear role for peripheral cannabinoid receptors in controlling spasticity in multiple sclerosis and EAE, the blood:CNS barriers are compromised in lesional areas and may provide selective access of therapeutic agents

[Butter, C. *et al*, *J. Neurol. Sci.* 1991, 104, 9-12; Daniel, P. M. *et al*, *J. Neurol. Sci.* 1983, 60, 367-376; Juhler, M. *et al*, *Brain Res.* 1984, 302, 347-355].

In addition to the aforementioned disorders, the present invention also has applications  
5 in other fields where tremor or muscle spasm is present or is manifested, such as  
incontinence, asthma, brochial spasms, hic-coughs etc.

Another aspect relates to the use of a compound of formula Ia according to the  
invention in the preparation of a medicament for controlling spasticity and tremors.

10

The compounds of the invention also have therapeutic applications in the treatment of  
various gastrointestinal disorders.

Peripheral CB<sub>1</sub> receptors are known to modulate gastrointestinal motility, intestinal  
15 secretion and gastroprotection. The digestive tract contains endogenous cannabinoids  
(anandamide and 2-arachidonoylglycerol), and cannabinoid CB<sub>1</sub> receptors can be found  
on myenteric and submucosal nerves. Activation of prejunctionally/presynaptically-  
located enteric (intestinal) CB<sub>1</sub> receptors produces inhibition of electrically-induced  
contractions (an effect which is associated to inhibition of acetylcholine release from  
20 enteric nerves) in various isolated intestinal tissues, including the human ileum and  
colon. Cannabinoid agonists inhibit intestinal motility in rodents *in vivo* and this effect  
is mediated, at least in part, by activation of peripheral (i.e. intestinal) CB<sub>1</sub> receptors,  
both in the upper gastrointestinal transit [Izzo, A. A. *et al*, *Br. J. Pharmacol.* 2000, 129,  
1627-1632; Landi, M. *et al*, *Eur. J. Pharmacol.* 2002, 450, 77-83] and in the colon  
25 [Pinto, L. *et al*, *Gastroenterology* 2002, 123, 227-234]. Thus, measurement of intestinal  
motility, *in vivo* is a useful model for evaluating the activity of peripheral-acting  
cannabinoid drugs.

Another aspect relates to the use of a compound of formula Ia according to the  
30 invention in the preparation of a medicament for treating a gastrointestinal disorder.

Preferably, the gastrointestinal disorder is selected from one or more of the following: gastric ulcers, Crohn's disease, secretory diarrhoea and paralytic ileus.

As used herein the term "paralytic ileus" refers to paralysis or inactivity of the intestine  
5 that prohibits the passage of material within the intestine. Typically, this may be the result of anticholinergic drugs, injury or illness. Paralytic ileus is a common occurrence post surgically.

Preferably for all of the above therapeutic applications, the modulator selectively  
10 modulates peripheral cannabinoid receptors.

Even more preferably, the modulator selectively modulates peripheral cannabinoid receptors over central cannabinoid receptors.

As used herein, the term "selectively" refers to modulators that are selective for  
15 peripheral cannabinoid receptors. Preferably they are selective over central cannabinoid receptors. Preferably the modulators of the invention have a selectivity ratio for peripheral cannabinoid receptors of greater than 10 to 1, more preferably greater than 100 to 1, more preferably greater than 300 to 1, over central cannabinoid  
20 receptors. Selectivity ratios may readily be determined by the skilled person.

For some applications, preferably the modulator of the present invention has a  $EC_{50}$   
value of less than about 1000 nM, preferably less than 100 nM, more preferably less than about 75 nM, even more preferably less than about 50 nM, preferably less than  
25 about 25 nM, preferably less than about 20 nM, preferably less than about 15 nM, preferably less than about 10 nM, preferably less than about 5 nM.

More preferably, the modulator binds substantially exclusively to peripheral cannabinoid receptors.

30

In one particularly preferred embodiment, the modulator is a cannabinoid receptor agonist. As used herein the term "agonist" is used in its normal sense in the art, i.e., a chemical compound which functionally activates the receptor to which it binds.

21

In one particularly preferred embodiment, the modulator does not substantially agonise central cannabinoid receptors.

Even more preferably still, the modulator is substantially excluded from the CNS.

5 Thus, the modulator is capable of modulating peripheral cannabinoid receptors without producing CNS effects, such as undesirable psychoactive effects.

Another aspect of the invention relates to a method of treating a disorder associated with the modulation of peripheral cannabinoid receptors, said method comprising  
10 administering to a subject in need thereof, a therapeutically effective amount of a compound of formula I as defined above.

Preferably, said disorder is associated with peripheral cannabinoid receptor deactivation.

15

## PHARMACEUTICAL COMPOSITIONS

A further aspect of the invention relates to a pharmaceutical composition comprising a compound of the invention, or pharmaceutically acceptable salt thereof, as defined above admixed with a pharmaceutically acceptable diluent, excipient or carrier.

20

Even though the compounds of the present invention (including their pharmaceutically acceptable salts, esters and pharmaceutically acceptable solvates) can be administered alone, they will generally be administered in admixture with a pharmaceutical carrier, excipient or diluent, particularly for human therapy. The pharmaceutical compositions  
25 may be for human or animal usage in human and veterinary medicine.

Examples of such suitable excipients for the various different forms of pharmaceutical compositions described herein may be found in the "Handbook of Pharmaceutical Excipients, 2<sup>nd</sup> Edition, (1994), Edited by A Wade and PJ Weller.

30

Acceptable carriers or diluents for therapeutic use are well known in the pharmaceutical art, and are described, for example, in Remington's Pharmaceutical Sciences, Mack Publishing Co. (A. R. Gennaro edit. 1985).

- 5    Examples of suitable carriers include lactose, starch, glucose, methyl cellulose, magnesium stearate, mannitol, sorbitol and the like. Examples of suitable diluents include ethanol, glycerol and water.

10   The choice of pharmaceutical carrier, excipient or diluent can be selected with regard to the intended route of administration and standard pharmaceutical practice. The pharmaceutical compositions may comprise as, or in addition to, the carrier, excipient or diluent any suitable binder(s), lubricant(s), suspending agent(s), coating agent(s), solubilising agent(s).

- 15   Examples of suitable binders include starch, gelatin, natural sugars such as glucose, anhydrous lactose, free-flow lactose, beta-lactose, corn sweeteners, natural and synthetic gums, such as acacia, tragacanth or sodium alginate, carboxymethyl cellulose and polyethylene glycol.

- 20   Examples of suitable lubricants include sodium oleate, sodium stearate, magnesium stearate, sodium benzoate, sodium acetate, sodium chloride and the like.

Preservatives, stabilizers, dyes and even flavoring agents may be provided in the pharmaceutical composition. Examples of preservatives include sodium benzoate,  
25   sorbic acid and esters of p-hydroxybenzoic acid. Antioxidants and suspending agents may be also used.

### **SALTS/ESTERS**

The compounds of the invention can be present as salts or esters, in particular  
30   pharmaceutically acceptable salts or esters.

Pharmaceutically acceptable salts of the compounds of the invention include suitable acid addition or base salts thereof. A review of suitable pharmaceutical salts may be found in Berge et al, J Pharm Sci, 66, 1-19 (1977). Salts are formed, for example with strong inorganic acids such as mineral acids, e.g. sulphuric acid, phosphoric acid or hydrohalic acids; with strong organic carboxylic acids, such as alkanecarboxylic acids of 1 to 4 carbon atoms which are unsubstituted or substituted (e.g., by halogen), such as acetic acid; with saturated or unsaturated dicarboxylic acids, for example oxalic, malonic, succinic, maleic, fumaric, phthalic or tetraphthalic; with hydroxycarboxylic acids, for example ascorbic, glycolic, lactic, malic, tartaric or citric acid; with aminoacids, for example aspartic or glutamic acid; with benzoic acid; or with organic sulfonic acids, such as (C<sub>1</sub>-C<sub>4</sub>)-alkyl- or aryl-sulfonic acids which are unsubstituted or substituted (for example, by a halogen) such as methane- or p-toluene sulfonic acid.

Esters are formed either using organic acids or alcohols/hydroxides, depending on the functional group being esterified. Organic acids include carboxylic acids, such as alkanecarboxylic acids of 1 to 12 carbon atoms which are unsubstituted or substituted (e.g., by halogen), such as acetic acid; with saturated or unsaturated dicarboxylic acid, for example oxalic, malonic, succinic, maleic, fumaric, phthalic or tetraphthalic; with hydroxycarboxylic acids, for example ascorbic, glycolic, lactic, malic, tartaric or citric acid; with aminoacids, for example aspartic or glutamic acid; with benzoic acid; or with organic sulfonic acids, such as (C<sub>1</sub>-C<sub>4</sub>)-alkyl- or aryl-sulfonic acids which are unsubstituted or substituted (for example, by a halogen) such as methane- or p-toluene sulfonic acid. Suitable hydroxides include inorganic hydroxides, such as sodium hydroxide, potassium hydroxide, calcium hydroxide, aluminium hydroxide. Alcohols include alkanealcohols of 1-12 carbon atoms which may be unsubstituted or substituted, e.g. by a halogen).

## ENANTIOMERS/TAUTOMERS

In all aspects of the present invention previously discussed, the invention includes, where appropriate all enantiomers and tautomers of compounds of formula I and Ia. The man skilled in the art will recognise compounds that possess an optical properties (one or more chiral carbon atoms) or tautomeric characteristics. The corresponding

enantiomers and/or tautomers may be isolated/prepared by methods known in the art. Thus, the invention encompasses the enantiomers and/or tautomers in their isolated form, or mixtures thereof, such as for example, racemic mixtures of enantiomers.

## 5 STEREO AND GEOMETRIC ISOMERS

Some of the specific agents of the invention may exist as stereoisomers and/or geometric isomers – e.g. they may possess one or more asymmetric and/or geometric centres and so may exist in two or more stereoisomeric and/or geometric forms. The present invention contemplates the use of all the individual stereoisomers and  
10 geometric isomers of those inhibitor agents, and mixtures thereof. The terms used in the claims encompass these forms, provided said forms retain the appropriate functional activity (though not necessarily to the same degree).

The present invention also includes all suitable isotopic variations of the agent or a  
15 pharmaceutically acceptable salt thereof. An isotopic variation of an agent of the present invention or a pharmaceutically acceptable salt thereof is defined as one in which at least one atom is replaced by an atom having the same atomic number but an atomic mass different from the atomic mass usually found in nature. Examples of isotopes that can be incorporated into the agent and pharmaceutically acceptable salts  
20 thereof include isotopes of hydrogen, carbon, nitrogen, oxygen, phosphorus, sulphur, fluorine and chlorine such as  $^2\text{H}$ ,  $^3\text{H}$ ,  $^{13}\text{C}$ ,  $^{14}\text{C}$ ,  $^{15}\text{N}$ ,  $^{17}\text{O}$ ,  $^{18}\text{O}$ ,  $^{31}\text{P}$ ,  $^{32}\text{P}$ ,  $^{35}\text{S}$ ,  $^{18}\text{F}$  and  $^{36}\text{Cl}$ , respectively. Certain isotopic variations of the agent and pharmaceutically acceptable salts thereof, for example, those in which a radioactive isotope such as  $^3\text{H}$  or  $^{14}\text{C}$  is incorporated, are useful in drug and/or substrate tissue distribution studies. Tritiated,  
25 i.e.,  $^3\text{H}$ , and carbon-14, i.e.,  $^{14}\text{C}$ , isotopes are particularly preferred for their ease of preparation and detectability. Further, substitution with isotopes such as deuterium, i.e.,  $^2\text{H}$ , may afford certain therapeutic advantages resulting from greater metabolic stability, for example, increased *in vivo* half-life or reduced dosage requirements and hence may be preferred in some circumstances. Isotopic variations of the agent of the  
30 present invention and pharmaceutically acceptable salts thereof of this invention can generally be prepared by conventional procedures using appropriate isotopic variations of suitable reagents.

**SOLVATES**

The present invention also includes solvate forms of the compounds of the present invention. The terms used in the claims encompass these forms.

**5 POLYMORPHS**

The invention furthermore relates to the compounds of the present invention in their various crystalline forms, polymorphic forms and (an)hydrous forms. It is well established within the pharmaceutical industry that chemical compounds may be isolated in any of such forms by slightly varying the method of purification and or  
10 isolation form the solvents used in the synthetic preparation of such compounds.

**PRODRUGS**

The invention further includes the compounds of the present invention in prodrug form. Such prodrugs are generally compounds of formula I and Ia wherein one or more  
15 appropriate groups have been modified such that the modification may be reversed upon administration to a human or mammalian subject. Such reversion is usually performed by an enzyme naturally present in such subject, though it is possible for a second agent to be administered together with such a prodrug in order to perform the reversion in vivo. Examples of such modifications include ester (for example, any of  
20 those described above), wherein the reversion may be carried out by an esterase etc. Other such systems will be well known to those skilled in the art.

**ADMINISTRATION**

The pharmaceutical compositions of the present invention may be adapted for oral,  
25 rectal, vaginal, parenteral, intramuscular, intraperitoneal, intraarterial, intrathecal, intrabronchial, subcutaneous, intradermal, intravenous, nasal, buccal or sublingual routes of administration.

For oral administration, particular use is made of compressed tablets, pills, tablets,  
30 gellules, drops, and capsules. Preferably, these compositions contain from 1 to 250 mg and more preferably from 10-100 mg, of active ingredient per dose.

Other forms of administration comprise solutions or emulsions which may be injected intravenously, intraarterially, intrathecally, subcutaneously, intradermally, intraperitoneally or intramuscularly, and which are prepared from sterile or sterilisable solutions. The pharmaceutical compositions of the present invention may also be in  
5 form of suppositories, pessaries, suspensions, emulsions, lotions, ointments, creams, gels, sprays, solutions or dusting powders.

An alternative means of transdermal administration is by use of a skin patch. For  
10 example, the active ingredient can be incorporated into a cream consisting of an aqueous emulsion of polyethylene glycols or liquid paraffin. The active ingredient can also be incorporated, at a concentration of between 1 and 10% by weight, into an ointment consisting of a white wax or white soft paraffin base together with such stabilisers and preservatives as may be required.

15

Injectable forms may contain between 10 - 1000 mg, preferably between 10 - 250 mg, of active ingredient per dose.

Compositions may be formulated in unit dosage form, i.e., in the form of discrete  
20 portions containing a unit dose, or a multiple or sub-unit of a unit dose.

## DOSAGE

A person of ordinary skill in the art can easily determine an appropriate dose of one of the instant compositions to administer to a subject without undue experimentation.  
25 Typically, a physician will determine the actual dosage which will be most suitable for an individual patient and it will depend on a variety of factors including the activity of the specific compound employed, the metabolic stability and length of action of that compound, the age, body weight, general health, sex, diet, mode and time of administration, rate of excretion, drug combination, the severity of the particular  
30 condition, and the individual undergoing therapy. The dosages disclosed herein are exemplary of the average case. There can of course be individual instances where

higher or lower dosage ranges are merited, and such are within the scope of this invention.

Depending upon the need, the agent may be administered at a dose of from 0.01 to 30 mg/kg body weight, such as from 0.1 to 10 mg/kg, more preferably from 0.1 to 1 mg/kg body weight.

In an exemplary embodiment, one or more doses of 10 to 150 mg/day will be administered to the patient.

10

## COMBINATIONS

In a particularly preferred embodiment, the one or more compounds of the invention are administered in combination with one or more other pharmaceutically active agents. In such cases, the compounds of the invention may be administered consecutively, simultaneously or sequentially with the one or more other pharmaceutically active agents.

## ASSAY

The present invention uses - and also encompasses - an assay, wherein said assay is used to screen for agents that can modulate cannabinoid receptors, more preferably, peripheral cannabinoid receptors. Details of such assays are presented later.

Thus, another aspect of the invention relates to the use of a compound of formula Ia, or a pharmaceutically acceptable salt thereof, in an assay for identifying further compounds capable of modulating cannabinoid receptor activity. Preferably, the assay is a competitive binding assay.

In such an assay, one or more of appropriate targets - such as an amino acid sequence and/or nucleotide sequence - may be used for identifying an agent capable of modulating peripheral cannabinoid receptors. The target employed in such a test may be free in solution, affixed to a solid support, borne on a cell surface, or located intracellularly. The abolition of target activity or the formation of binding complexes

30

between the target and the agent being tested may be measured.

The assay of the present invention may be a screen, whereby a number of agents are tested. In one aspect, the assay method of the present invention is a high through put  
5 screen.

Techniques for drug screening may be based on the method described in Geysen, European Patent Application 84/03564, published on September 13, 1984. In summary, large numbers of different small peptide test compounds are synthesized on a  
10 solid substrate, such as plastic pins or some other surface. The peptide test compounds are reacted with a suitable target or fragment thereof and washed. Bound entities are then detected - such as by appropriately adapting methods well known in the art. A purified target can also be coated directly onto plates for use in a drug screening techniques. Alternatively, non-neutralising antibodies can be used to capture the  
15 peptide and immobilise it on a solid support.

This invention also contemplates the use of competitive drug screening assays in which neutralising antibodies capable of binding a target specifically compete with a test compound for binding to a target.

20

Another technique for screening provides for high throughput screening (HTS) of agents having suitable binding affinity to the substances and is based upon the method described in detail in WO-A-84/03564.

25 It is expected that the assay methods of the present invention will be suitable for both small and large-scale screening of test compounds as well as in quantitative assays.

In a preferred aspect, the assay of the present invention utilises cells that display CB1 receptors on their surface. These cells may be isolated from a subject possessing such  
30 cells. However, preferably, the cells are prepared by transfecting cells so that upon transfection those cells display on their surface CB1 receptors.

One aspect of the invention relates to a process comprising the steps of:

- (a) performing an assay method described hereinabove;
- (b) identifying one or more candidate compounds capable of modulating one or more cannabinoid receptors; and
- 5 (c) preparing a quantity of said one or more candidate compounds.

Another aspect of the invention provides a process comprising the steps of:

- (a) performing an assay method described hereinabove;
- (b) identifying one or more candidate compounds capable of modulating one or  
10 more cannabinoid receptors;
- (c) preparing a pharmaceutical composition comprising said one or more candidate compounds.

Another aspect of the invention provides a process comprising the steps of:

- 15 (a) performing an assay method described hereinabove;
- (b) identifying one or more candidate compounds capable of modulating one or more cannabinoid receptors;
- (c) modifying said one or more candidate compounds capable of modulating one or more cannabinoid receptors;
- 20 (d) performing the assay method described hereinabove;
- (e) optionally preparing a pharmaceutical composition comprising said one or more candidate compounds.

The invention also relates to candidate compounds identified by the method described  
25 hereinabove.

Yet another aspect of the invention relates to a pharmaceutical composition comprising a candidate compound identified by the method described hereinabove.

30 Another aspect of the invention relates to the use of a candidate compound identified by the method described hereinabove in the preparation of a pharmaceutical composition for use in the treatment of muscular disorders and/or gastrointestinal disorders.

The above methods may be used to screen for a candidate compound useful as an modulators of one or more cannabinoid receptors, more preferably peripheral cannabinoid receptors.

## 5 REPORTERS

A wide variety of reporters may be used in the assay methods (as well as screens) of the present invention with preferred reporters providing conveniently detectable signals (eg. by spectroscopy). By way of example, a reporter gene may encode an enzyme which catalyses a reaction which alters light absorption properties.

10

Other protocols include enzyme-linked immunosorbent assay (ELISA), radioimmunoassay (RIA) and fluorescent activated cell sorting (FACS). A two-site, monoclonal-based immunoassay utilising monoclonal antibodies reactive to two non-interfering epitopes may even be used. These and other assays are described, among  
15 other places, in Hampton R et al [1990, Serological Methods, A Laboratory Manual, APS Press, St Paul MN] and Maddox DE et al [1983, J Exp Med 15 8:121 1].

Examples of reporter molecules include but are not limited to (galactosidase, invertase, green fluorescent protein, luciferase, chloramphenicol, acetyltransferase,  
20 (glucuronidase, exo-glucanase and glucoamylase. Alternatively, radiolabelled or fluorescent tag-labelled nucleotides can be incorporated into nascent transcripts which are then identified when bound to oligonucleotide probes.

By way of further examples, a number of companies such as Pharmacia Biotech  
25 (Piscataway, NJ), Promega (Madison, WI), and US Biochemical Corp (Cleveland, OH) supply commercial kits and protocols for assay procedures. Suitable reporter molecules or labels include those radionuclides, enzymes, fluorescent, chemiluminescent, or chromogenic agents as well as substrates, cofactors, inhibitors, magnetic particles and the like. Patents teaching the use of such labels include US-A-  
30 3817837; US-A-3850752; US-A-3939350; US-A-3996345; US-A-4277437; US-A-4275149 and US-A-4366241.

**CB1 RECEPTOR AND CB2 RECEPTOR BINDING ASSAYS**

Details of a CB1 receptor binding assay and a CB2 receptor binding assay may be found in Petrocellis et al [2000 FEBS Letter 483 52-56] . The relevant information about those assays from that reference now follows. Other assays may be used.

5

Displacement assays for CB<sub>1</sub> receptors were carried out by using [<sup>3</sup>H]SR141716A (0.4nM, 55 Ci/mmol, Amersham) as the high affinity ligand, and the filtration technique previously described [12-14], on membrane preparations (0.4 mg/tube) from frozen male CD rat brains (Charles River Italia) and in the presence of 100 μM PMSF.

10 Specific binding was calculated with 1 μM SR 14176A (a gift from Sanofi Recherche, France) and was 84.0%. The spleen from CD rats were used to prepare membranes (0.4 mg/tube) to carry out CB<sub>2</sub> binding assays by using [<sup>3</sup>H]WIN55,212-2 (0.8nM, 50.8 CI/mmol, NEN-Dupont) as described previously [14], and again in the presence of 100 μM PMSF. Specific binding was calculated with 1 μM HU-348 (a gift from Prof. R.  
15 Mechoulam and Pharmsos) and was 75.0%. In all cases, *K<sub>i</sub>* values were calculated by applying the Cheng-prusoff equation to the IC<sub>50</sub> values (obtained by GraphPad) for the displacement of the bound radioligand by increasing concentrations of the test compounds. [Details on the specific references may be found in the document itself.]

20 **HOST CELLS**

Polynucleotides for use in the present invention – such as for use as modulators or for expressing modulators - may be introduced into host cells.

The term “host cell” - in relation to the present invention includes any cell that could  
25 comprise the modulator of the present invention.

Here, polynucleotides may be introduced into prokaryotic cells or eukaryotic cells, for example yeast, insect or mammalian cells.

30 Polynucleotides of the invention may introduced into suitable host cells using a variety of techniques known in the art, such as transfection, transformation and electroporation. For example, it is possible to cause transformation with recombinant viral vectors such

as retroviruses, herpes simplex viruses and adenoviruses, direct injection of nucleic acids and biolistic transformation.

Thus, a further embodiment of the present invention provides host cells transformed or transfected with a polynucleotide that is or expresses the target of the present invention. Preferably said polynucleotide is carried in a vector for the replication and expression of polynucleotides that are to be the target or are to express the target. The cells will be chosen to be compatible with the said vector and may for example be prokaryotic (for example bacterial), fungal, yeast or plant cells.

10

The gram negative bacterium *E. coli* is widely used as a host for heterologous gene expression. However, large amounts of heterologous protein tend to accumulate inside the cell. Subsequent purification of the desired protein from the bulk of *E. coli* intracellular proteins can sometimes be difficult.

15

In contrast to *E. coli*, bacteria from the genus *Bacillus* are very suitable as heterologous hosts because of their capability to secrete proteins into the culture medium. Other bacteria suitable as hosts are those from the genera *Streptomyces* and *Pseudomonas*.

Depending on the nature of the polynucleotide encoding the polypeptide of the present invention, and/or the desirability for further processing of the expressed protein, eukaryotic hosts such as yeasts or other fungi may be preferred. In general, yeast cells are preferred over fungal cells because they are easier to manipulate. However, some proteins are either poorly secreted from the yeast cell, or in some cases are not processed properly (e.g. hyperglycosylation in yeast). In these instances, a different fungal host organism should be selected.

Examples of suitable expression hosts within the scope of the present invention are fungi such as *Aspergillus* species (such as those described in EP-A-0184438 and EP-A-0284603) and *Trichoderma* species; bacteria such as *Bacillus* species (such as those described in EP-A-0134048 and EP-A-0253455), *Streptomyces* species and *Pseudomonas* species; and yeasts such as *Kluyveromyces* species (such as those described in EP-A-0096430 and EP-A-0301670) and *Saccharomyces* species. By way

30

of example, typical expression hosts may be selected from *Aspergillus niger*,  
*Aspergillus niger* var. *tubigenis*, *Aspergillus niger* var. *awamori*, *Aspergillus aculeatis*,  
*Aspergillus nidulans*, *Aspergillus oryzae*, *Trichoderma reesei*, *Bacillus subtilis*,  
*Bacillus licheniformis*, *Bacillus amyloliquefaciens*, *Kluyveromyces lactis* and  
5 *Saccharomyces cerevisiae*.

Polypeptides that are extensively modified may require correct processing to complete  
their function. In those instances, mammalian cell expression systems (such as HEK-  
293, CHO, HeLA) are required, and the polypeptides are expressed either  
10 intracellularly, on the cell membranes, or secreted in the culture media if preceded by  
an appropriate leader sequence.

The use of suitable host cells - such as yeast, fungal, plant and mammalian host cells -  
may provide for post-translational modifications (e.g. myristoylation, glycosylation,  
15 truncation, lipidation and tyrosine, serine or threonine phosphorylation) as may be  
needed to confer optimal biological activity on recombinant expression products of the  
present invention.

## ORGANISM

20 The term "organism" in relation to the present invention includes any organism that  
could comprise the target according to the present invention and/or products obtained  
therefrom. Examples of organisms may include a fungus, yeast or a plant.

The term "transgenic organism" in relation to the present invention includes any  
25 organism that comprises the target according to the present invention and/or products  
obtained.

## TRANSFORMATION OF HOST CELLS/HOST ORGANISMS

As indicated earlier, the host organism can be a prokaryotic or a eukaryotic organism.  
Examples of suitable prokaryotic hosts include *E. coli* and *Bacillus subtilis*. Teachings  
30 on the transformation of prokaryotic hosts is well documented in the art, for example  
see Sambrook et al [Molecular Cloning: A Laboratory Manual, 2nd edition, 1989, Cold  
Spring Harbor Laboratory Press] and Ausubel et al, [Current Protocols in Molecular

Biology (1995), John Wiley & Sons, Inc].

If a prokaryotic host is used then the nucleotide sequence may need to be suitably modified before transformation - such as by removal of introns.

5

In another embodiment the transgenic organism can be a yeast. In this regard, yeast have also been widely used as a vehicle for heterologous gene expression. The species *Saccharomyces cerevisiae* has a long history of industrial use, including its use for heterologous gene expression. Expression of heterologous genes in *Saccharomyces*  
10 *cerevisiae* has been reviewed by Goodey et al [1987, Yeast Biotechnology, D R Berry et al, eds, pp 401-429, Allen and Unwin, London] and by King et al [1989, Molecular and Cell Biology of Yeasts, E F Walton and G T Yarronton, eds, pp 107-133, Blackie, Glasgow].

15 For several reasons *Saccharomyces cerevisiae* is well suited for heterologous gene expression. First, it is non-pathogenic to humans and it is incapable of producing certain endotoxins. Second, it has a long history of safe use following centuries of commercial exploitation for various purposes. This has led to wide public acceptability. Third, the extensive commercial use and research devoted to the  
20 organism has resulted in a wealth of knowledge about the genetics and physiology as well as large-scale fermentation characteristics of *Saccharomyces cerevisiae*.

A review of the principles of heterologous gene expression in *Saccharomyces cerevisiae* and secretion of gene products is given by E Hinchcliffe E Kenny [1993,  
25 "Yeast as a vehicle for the expression of heterologous genes", Yeasts, Vol 5, Anthony H Rose and J Stuart Harrison, eds, 2nd edition, Academic Press Ltd.].

Several types of yeast vectors are available, including integrative vectors, which require recombination with the host genome for their maintenance, and autonomously replicating plasmid vectors.

30

In order to prepare the transgenic *Saccharomyces*, expression constructs are prepared by inserting the nucleotide sequence of the present invention into a construct designed

for expression in yeast. Several types of constructs used for heterologous expression have been developed. The constructs contain a promoter active in yeast fused to the nucleotide sequence of the present invention, usually a promoter of yeast origin, such as the GAL1 promoter, is used. Usually a signal sequence of yeast origin, such as the sequence encoding the SUC2 signal peptide, is used. A terminator active in yeast ends the expression system.

For the transformation of yeast several transformation protocols have been developed. For example, a transgenic *Saccharomyces* according to the present invention can be prepared by following the teachings of Hinnen et al [1978, Proceedings of the National Academy of Sciences of the USA 75, 1929]; Beggs, J D [1978, Nature, London, 275, 104]; and Ito, H et al [1983, J Bacteriology 153, 163-168].

The transformed yeast cells are selected using various selective markers. Among the markers used for transformation are a number of auxotrophic markers such as LEU2, HIS4 and TRP1, and dominant antibiotic resistance markers such as aminoglycoside antibiotic markers, eg G418.

Another host organism is a plant. The basic principle in the construction of genetically modified plants is to insert genetic information in the plant genome so as to obtain a stable maintenance of the inserted genetic material. Several techniques exist for inserting the genetic information, the two main principles being direct introduction of the genetic information and introduction of the genetic information by use of a vector system. A review of the general techniques may be found in articles by Potrykus [Annu Rev Plant Physiol Plant Mol Biol [1991] 42:205-225] and Christou [Agro-Food-Industry Hi-Tech March/April 1994 17-27]. Further teachings on plant transformation may be found in EP-A-0449375.

Further hosts suitable for the nucleotide sequence of the present invention include higher eukaryotic cells, such as insect cells or vertebrate cells, particularly mammalian cells, including human cells, or nucleated cells from other multicellular organisms. In recent years propagation of vertebrate cells in culture (tissue culture) has become a

routine procedure. Examples of useful mammalian host cell lines are epithelial or fibroblastic cell lines such as Chinese hamster ovary (CHO) cells, NIH 3T3 cells, HeLa cells or 293T cells.

- 5 The nucleotide sequence of the present invention may be stably incorporated into host cells or may be transiently expressed using methods known in the art. By way of example, stably transfected mammalian cells may be prepared by transfecting cells with an expression vector having a selectable marker gene, and growing the transfected cells under conditions selective for cells expressing the marker gene. To prepare  
10 transient transfectants, mammalian cells are transfected with a reporter gene to monitor transfection efficiency.

- To produce such stably or transiently transfected cells, the cells should be transfected with a sufficient amount of the nucleotide sequence of the present invention. The  
15 precise amounts of the nucleotide sequence of the present invention may be empirically determined and optimised for a particular cell and assay.

- Thus, the present invention also provides a method of transforming a host cell with a nucleotide sequence that is to be the target or is to express the target. Host cells  
20 transformed with the nucleotide sequence may be cultured under conditions suitable for the expression of the encoded protein. The protein produced by a recombinant cell may be displayed on the surface of the cell. If desired, and as will be understood by those of skill in the art, expression vectors containing coding sequences can be designed with signal sequences which direct secretion of the coding sequences through a particular  
25 prokaryotic or eukaryotic cell membrane. Other recombinant constructions may join the coding sequence to nucleotide sequence encoding a polypeptide domain which will facilitate purification of soluble proteins [Kroll DJ et al (1993) DNA Cell Biol 12:441-53].

- 30 The present invention is further described by way of example, and with reference to the following figures wherein:

Figure 1 shows rat vas deferens inhibition of contractions. In more detail, the  $IC_{50}$  of compound (16) in this assay is approximately 0.1nm. In the same assay *R(+)*WIN55,212 demonstrated an  $IC_{50}$  at CB1 of approximately 5nm, consistent with its known binding affinity. This assay demonstrates agonist potential and the effect of compound (16) was neutralised by the CB1-antagonist SR141716A.

Figure 2 shows hypomotility in wildtype mice.

Figure 3 shows hypothermia in wildtype mice. Temperature and 5 minute motility in a 27cm<sup>2</sup> openfield in activity chamber was assessed [Brooks et al 2002] before and after (20min) injection of vehicle (alcohol, cremophor, PBS (1:1:18), compound (16) or the CNS-penetrant CB1 agonist (*R(+)*)Win 55,212. This latter compound induced typical cannabinimimetic effects whereas compound (16) was inactive at 1mg/kg (above) and even at 20mg/kg i.v.

15

Figure 4 shows the assessment of spasticity in CREAE mice. Spasticity developed following the development of chronic EAE induced by injection of mouse spinal cord homogenate in Freund's complete adjuvant on day 0 & 7. This occurred 60-80 days post-induction in wildtype ABH.*Cnr1*<sup>+/+</sup> mice and 30-40 days post-induction in CB1 receptor gene (*Cnr1*)-deficient ABH.*Cnr1*<sup>-/-</sup> mice). Spasticity was assessed by resistance to full flexion of hindlimbs against a strain gauge [Baker et al 2000], before and after treatment with either the full CB<sub>1</sub>/CB<sub>2</sub> agonist CP55,940 or full CB<sub>1</sub>/CB<sub>2</sub>/"CB<sub>3</sub>" agonist injected intraperitoneally or compound (16) injected intravenously in vehicle (alcohol:cremophor:PBS (1:1:18)). The results represents the percentage change  $\pm$  SEM from baseline (n<10-12per group) 10minutes after administration. Statistical analysis was performed on raw data and were analysed pairwise from baseline levels (\*\*\* P<0.001). The anti-spastic effects of CNS-penetrant agonists were lost in CB<sub>1</sub>-deficient mice indicating that CB<sub>2</sub>/"CB<sub>3</sub>" is not a target for anti-spastic activity. Vehicle alone was inactive [Baker et al 2000]. Compound (16) exhibited significant anti-spastic activity in wildtype mice and was active when administered in PBS alone (not shown).

30

**EXAMPLES**

The compounds were purified by reverse-phase HPLC (Gilson) using preparative C-18 column (Hypersil PEP 100x21 mm internal diameter, 5 $\mu$ m particle size, and 100Å pore size) and isocratic gradient over 20 minutes.

5 *N*-(2-hydroxy-1-methyl-ethyl)-3-iodobenzamide (**1**)

To a solution of 3-iodobenzoic acid (10.02g, 40.30mmol), in dry dichloromethane, at room temperature (180mL) under a nitrogen atmosphere, EDCI (7.72g, 40.30mmol) was added followed by triethylamine (8.0mL, 60.45mmol) and the mixture was stirred at room temperature for further 5 minutes. DL Alaninol (3.02g, 40.3mmol) was then added and the mixture stirred at room temperature for 16 hrs. The reaction mixture was washed with a mixture of saturated brine and saturated sodium bicarbonate (1:1; 2x150mL) followed by saturated brine solution (100mL). The organics were separated and dried over magnesium sulfate and the solvent evaporated under vacuum. The residue was purified by flash column chromatography on silica gel (DCM:MeOH, 1% to 8% methanol gradient) to afford compound **1** (4.14g, 13.6 mmol, 34% yield) as an off white solid.

20  $\delta(^1\text{H})$ (CDCl<sub>3</sub>); 1.41 (3H, d,  $J$  6.8Hz), 3.70 (1H, dd,  $J_1$  5.5,  $J_2$  10.9Hz), 3.80 (1H, dd,  $J_1$  2.9,  $J_2$  10.9Hz), 4.38 (1H, m), 6.46 (1H, m), 7.27 (2H, t,  $J$  7.8Hz), 7.93 (1H, d,  $J$  7.88 Hz), 8.21 (1H, s).

General procedure for Sonogashira coupling reactionMethod A

[*Tetrahedron* 2000, 56, 4777-4792] Bis(triphenylphosphine)palladium(II) chloride (3.5% mol), copper(I)iodide (8% mol) and triethylamine (4 mmol) were added to a solution of *N*-(2-hydroxy-1-methyl-ethyl)-3-iodobenzamide (1) (1 mmol) in DMF (5mL). The mixture was stirred for 1h under a nitrogen atmosphere at room temperature. The alkyne (1 mmol) was added and the reaction mixture was stirred at 60°C for 2 hours. The reaction mixture was concentrated under vacuum and the residue was purified by short flash chromatography on silica gel (DCM:MeOH, 1% to 4% methanol gradient) to afford the desire compound.

*N*-(2-Hydroxy-1-methyl-ethyl)-3-(5-hydroxy-pent-1-ynyl)-benzamide (2)

Method A was used to synthesise the named compound (2), coupling (1) (0.50g, 1.64mmol) with 4-pentyl-1-ol to yield *N*-(2-hydroxy-1-methyl-ethyl)-3-(5-hydroxy-pent-1-ynyl)-benzamide (2) (0.314g, 1.20mmol; 73%).

$\delta(^1\text{H})$ (CDCl<sub>3</sub>); 1.19 (3H, d, *J* 6.8Hz), 1.68-1.81 (3H, m), 2.45 (2H, t, *J* 6.9Hz), 3.04-3.17 (1H, m), 3.39-3.74 (5H, m), 4.12-4.23 (1H, m), 6.52 (1H, d, *J* 7.2Hz), 7.22 (1H, dd, *J*<sub>1</sub> 6.3, *J*<sub>2</sub> 11.67 Hz), 7.39 (1H, d, *J* 7.7 Hz), 7.60 (1H, d, *J* 7.8 Hz), 7.68 (1H, s).

15 Method B

[*J. Org. Chem.* 1999, 64, 4777-4792; *J. Med. Chem.* 1998, 41, 420-427]  
Tetrakis(triphenylphosphine)palladium(0) (2% mol) and copper(I) iodide (7% mol) were added to pyrrolidine (15 mL) in a round-bottomed flask and stirred at room temperature under a nitrogen atmosphere, for 5 minutes. To this solution *N*-(2-  
20 hydroxy-1-methyl-ethyl)-3-iodobenzamide (1 mmol) was added and stirred for an additional 15 minutes at room temperature. The alkyne (1 mmol) was added and the reaction mixture was stirred at 60°C for 3 hours. The reaction mixture was concentrated under vacuum, the residue was treated with DOWEX50 WX80 (10 x weight of the starting material); DOWEX50 WX80 was washed with acetonitrile (3x20  
25 mL), then suspended in a mixture of acetonitrile/water (3/1). The residue above was dissolved in acetonitrile/water (1:1, 20 mL), and was added to the resin suspension and shaken for 20 minutes. The resin was filtered off, washed with acetonitrile/water (3/1) and the solvent removed from the filtrate under vacuum. The residue purified by short flash column chromatography on silica gel (DCM:MeOH:AcOH, 1% to 8% methanol  
30 gradient, with 1% AcOH) to yield the desired compound.

42

**Method B<sup>1</sup>:** The treatment of the crude material with DOWEX50 WX80 was performed in the presence of methanol instead of acetonitrile/water (3/1).

*6-[3-(2-Hydroxy-1-methyl-ethylcarbamoyl)phenyl]-hex-5-ynoic acid (4)*

4

5

The iodobenzamide (1) (2.00g, 6.5mmol) was coupled with 5-hexynoic acid using method B giving product (4) (1.87g, 6.42mmol; 99% yield).

10  $\delta(^1\text{H})(\text{CDCl}_3)$ ; 1.49 (3H, d,  $J$  6.8Hz), 2.14 (2H, t,  $J$  7.2Hz), 2.67-2.76 (4H, m), 3.83-3.90 (2H, m) 4.39-4.45 (1H, m) 7.64 (1H, t,  $J$  7.7Hz), 7.76 (1H, d,  $J$  7.7Hz), 7.99 (1H, d,  $J$  7.8Hz), 8.10 (1H, s).

### Synthesis of amides

#### 10 Method C:

To a solution of the alkynoic acid (1mmol) in dry THF (6mL) under nitrogen atmosphere, triethylamine (2mmol) was added and then cooled at  $-10^\circ\text{C}$ . To the reaction mixture ethyl chloroformate (1mmol) was added and then stirred for further 15 minutes at  $-10^\circ\text{C}$ . In the meantime a solution of amine hydrochloride (3 mmol),  
 15 water (0.88mL), triethylamine (0.63mL, 6mmol) and THF (1.76mL) was prepared and added dropwise to the reaction mixture. The reaction was left warming up to  $5^\circ\text{C}$  in 1.5 h and then stirred at room temperature for a further 30 minutes. The mixture was poured into a 1:1 mixture of saturated brine and saturated sodium bicarbonate (50 mL) and then extracted with DCM (5x50mL). The organic layer was evaporated under  
 20 vacuum, the residue was purified by short column chromatography on silica gel (DCM:MeOH, 1% to 10% methanol gradient) to give the desired compound.

*3-(5-Dimethylcarbamoyl-pent-1-ynyl)-N-(2-hydroxy-1-methyl-ethyl)benzamide (8)*

8

46

6-[3-(2-Hydroxy-1-methyl-ethylcarbamoyl)phenyl]-hex-5-ynoic acid (4) (0.109g, 0.377mmol) was reacted using method C with dimethylamine hydrochloride to obtain 8 (0.115g, 0.363mmol; 96% yield).

General method for Lindlar hydrogenationMethod D:

Quinoline (143 $\mu$ L, 1.3mmol), palladium on barium sulphate reduced (5%) (143mg) and the alkyne (1mmol) were combined in methanol (14mL) and stirred under atmospheric pressure of hydrogen until the  $^1\text{H}$ NMR of the crude showed that the reduction was complete. The catalyst was removed by filtration through a pad of celite, which was washed several times with methanol. The filtrate was evaporated under vacuum and the product was purified by preparative HPLC.

10 Method E:

Quinoline (25 $\mu$ L, 0.21mmol), palladium on barium sulphate reduced (5%) (360mg) and the alkyne (1mmol) were combined in methanol (15mL) and stirred under atmospheric pressure of hydrogen until the  $^1\text{H}$ NMR of the crude showed that the reduction was complete. The catalyst was removed by filtration through a pad of celite, which was washed several times with methanol. The filtrate was evaporated under vacuum and the product was purified by preparative HPLC.

*3-Hept-1-enyl-N-(2-hydroxy-1-methyl-ethyl)-benzamide (11)*

11

20

Hydrogenation of the alkyne **3** (0.050g, 0.18mmol) using method D gave two products, which were separated by preparative reverse-phase HPLC chromatography (55% acetonitrile/45% water 20 min isocratic program), named compound **11** (12mg) ( and the fully reduced compound 3-heptyl-N-(2-hydroxy-1-methyl-ethyl)-benzamide (**12**) (7mg).

*3-(6-Dimethylcarbamoyl-hex-1-enyl)-N-(2-hydroxy-1-methyl-ethyl)-benzamide* (0.037g, 0.11mmol) **17** was synthesized by Lindlar catalyzed reduction using the method D to obtain a mixture of **17** and the saturated compound plus 20% of the trans isomer which were separated by preparative HPLC, unfortunately the separation of the

56

cis and trans isomers was not very successful and the compound **17** (15mg) was contaminated with some trans isomer (10% trans).

*6-[3-(2-Hydroxy-1-methyl-ethylcarbamoyl)-phenyl]-hex-5-enoic acid methyl ester (21)*

**21**

6-[3-(2-Hydroxy-1-methyl-ethylcarbamoyl)-phenyl]-hex-5-enoic acid methyl ester (**21**) (0.100g, 1.7mmol) was synthesized by Lindlar catalyzed reduction from the alkyne **20** using method D, to obtain a mixture of **21** and 5% of the trans isomer which was not separated. The mixture was used as a crude.

$\delta(^1\text{H})(\text{CD}_3\text{OD})$ ; 1.15 (3H, t,  $J$  6.7Hz), 1.52-1.71 (2H, m), 2.19-2.29 (4H, m), 3.47-3.56 (2H, mz), 4.06-4.12 (2H, m), 5.59-5.67 (1H, m), 5.46 (2H, bs), 5.62-5.68 (1H, m), 6.39 (1H, d,  $J$  11.6Hz), 7.25-7.33 (1H, m), 7.41 (1H, d,  $J$  8.0 Hz), 7.52-7.61 (2H, m).

*3-(5-Carbamoyl-pent-1-enyl)-N-(2-hydroxy-1-methyl-ethyl)-benzamide(19)*

**19**

**21** (0.030g, 0.10mmol) was dissolved in 2mL of ammonia 33% solution in water and stirred at room temperature for 8h. The solvent was removed and the product was purified by reverse-phase HPLC chromatography (18%acetonitrile/82%water 20 min isocratic program) to give **19** (7mg).

#### General method for BER/Ni hydrogenation

Borohydride polymer-supported (borohydride on amberlite IRA-400 2.5mmol  $\text{BH}_4^-$ /1g resin) (BER) (0.750g) and nickel acetate tetra hydrate (0.046g, 1.9mmol) were  
 10 suspended in 7 mL of methanol, hydrogen was bubbled through the suspension until a black coating of nickel appeared on the resin, then to the mixture under hydrogen the alkyne (1mmol) was added dissolved in 7mL of methanol. The mixture was shaken for 9 hours and then filtered. The resin was washed several times with methanol and then the combined filtrate was evaporated under vacuum. The residue was dissolved in an  
 15 appropriate solvent and filtered though celite to remove the nickel. The product was purified by preparative reverse-phase HPLC chromatography.

#### *3-(4-Dimethylcarbamoyl-but-1-enyl)-N-(2-hydroxy-1-methyl-ethyl)-benzamide (27)*

27

20

Hydrogenation of the alkyne **9** (0.055g, 0.18mmol) using BER/Ni catalyst gave 40% **27**, 5% of the saturated compound and 55% of starting material. The mixture was separated by reverse-phase HPLC chromatography (20% acetonitrile/80% water 20 min isocratic program) to give **27** (15mg).

5 Validation as CB<sub>1</sub> agonists with peripheral action

In vitro Radioligand Binding Studies

Radioligand binding assays [Ross, R. A. *et al*, *Br. J. Pharmacol.* 1999, 128, 735-743] are carried out with the CB<sub>1</sub> receptor antagonist [3H]SR141716A (0.5nM) or [3H]CP55940 (0.5nM) in brain and spleen membranes. Assays are performed in assay  
10 buffer containing 1 mg/mL BSA, the total assay volume being 500  $\mu\text{L}$ . Binding is initiated by the addition of membranes (100  $\mu\text{g}$ ). The vehicle concentration of 0.1% DMSO is kept constant throughout. Assays are carried out at 37°C for 60 minutes before termination by addition of ice-cold wash buffer (50 mM Tris buffer, 1 mg/mL BSA) and vacuum filtration using a 12-well sampling manifold (Brandel Cell  
15 Harvester) and Whatman GF/B glass-fibre filters that had been soaked in wash buffer at 4°C for 24 hours. Each reaction tube is washed five times with a 4-mL aliquot of buffer. The filters are oven-dried for 60 minutes and then placed in 5 mL of scintillation fluid (Ultima Gold XR, Packard), and radioactivity quantitated by liquid scintillation spectrometry. Specific binding is defined as the difference between the  
20 binding that occurred in the presence and absence of 1  $\mu\text{M}$  unlabelled ligand and is 71% and 40% of the total radio-ligand bound in brain and spleen respectively. The concentrations of competing ligands (test compounds) to produce 50% displacement of the radioligand (IC<sub>50</sub>) from specific binding sites is calculated using GraphPad Prism (GraphPad Software, San Diego). Inhibition constant ( $K_i$ ) values are calculated using  
25 the equation of Cheng & Prusoff [Cheng, Y. and Prusoff, W. H., *Biochem. Pharmacol.* 1973, 22, 3099-3108].

In vitro cannabinoid receptor modulating activity

Compounds are evaluated for cannabinoid modulation potential using a mouse vas  
30 deferens preparation [Ward S, Mastriani D, Casiano F and Arnold R (1990) *J Pharmacol Exp Ther* 255:1230–1239] which provides evidence for CB agonism, rather than simple receptor binding which does not always reflect agonist potential.

Compound (16) showed significant effects in this system (Figure 1) with an  $IC_{50}$  of ~1 nM compared to the known full agonist R(+) WIN55,212 ( $IC_{50}$  ~5 nM). This was inhibited by the selective  $CB_1$  antagonist SR141716A indicating that the observed contraction was mediated via the peripheral  $CB_1$  receptor.

5

#### In vivo peripheral $CB_1$ receptor activation

##### Upper gastrointestinal transit

Gastrointestinal transit is measured using the charcoal method. Mice receive orally 0.1 mL (10 g/mouse) of a black marker (10% charcoal suspension in 5% gum arabic), and  
10 after 20 minutes the mice are killed by asphyxiation with  $CO_2$  and the small intestine removed. The distance traveled by the marker is measured and expressed as a percentage of the total length of the small intestine from pylorus to caecum [Izzo, A. A. *et al*, *Br. J. Pharmacol.* 2000, 129, 1627-1632]. Cannabinoid agonists are given 30 min before charcoal administration.

15

##### Colonic propulsion test

Distal colonic propulsion is measured according to Pinto *et al* [*Gastroenterology* 2002, 123, 227-234]. Thirty minutes after the administration of cannabinoid drugs, a single 3 mm glass bead is inserted 2 cm into the distal colon of each mouse. The time required  
20 for expulsion of the glass bead was determined for each animal. The higher mean expulsion time value is an index of a stronger inhibition of colonic propulsion.

##### Psychotropic Activity of Peripherally Active Cannabinoids

Many  $CB_1$  agonists are known to induce psychotropic associated "tetrad effects" due  
25 to central binding to  $CB$  receptors [Howlett, A. C. *et al*, *International Union of Pharmacology. XXVII, Pharmacol. Rev.* 2002, 54, 161-202]. Studies were undertaken to investigate whether the compounds of the present invention also bound to central  $CB_1$  receptors. This is assessed by measuring the ability of the compounds to induce sedation, ptosis, hypomotility, catalepsy and hypothermia in normal mice [Brooks, J.  
30 W. *et al*, *Eur. J. Pharmacol.* 2002, 439, 83-92], following i.v., i.p. and oral administration.

### Determination of compound brain levels

#### Quantitation of permeability into brain and spinal cord

Brain/spinal cord penetration of the compounds may be measured directly as follows.

- 5 Brain and spinal cord uptake in anaesthetised rat is measured using the standard method set forth in Ohno *et al* [Ohno, K. *et al*, *Am. J. Physiol* 1978, 235, H299-H307]. In brief, the compound is injected intravenously (femoral), as either single bolus or stepped infusion. Several plasma samples (femoral artery) are taken to calculate the plasma concentration over time (integral, area under the curve). Terminal brain and spinal cord
- 10 samples are taken to measure brain penetration (correcting for compound in residual blood by either saline washout or by measuring contained blood volume using short circulation of an inert low permeability marker such as [ $^{14}\text{C}$ ] sucrose).  $PS$  ( $\text{cm.s}^{-1}$ ), is equal to  $C_{\text{brain}}/\text{integral } C_{\text{plasma}}$ , where  $PS$  = permeability  $\times$  surface area ( $\text{cm}^2$ ) product for brain uptake, and  $C$  is concentration. Alternatively, a steady state
- 15 tissue/plasma ratio is measured as a more approximate index, again with blood washout or correction. Comparison is made with control compounds known to have low permeability across the BBB, e.g. radiolabelled sucrose or insulin, run under identical conditions.

#### 20 Preliminary characterization of the biology of $\text{CB}_1$ agonism

##### Nociceptive Activity of Peripherally Active Cannabinoids

There is evidence for  $\text{CB}_1$  mediated nociception in the periphery [Fox, A. *et al*, *Pain* 2001, 92, 91-100]. Studies on partial sciatic nerve ligation were therefore undertaken in rats and knockout mice.

25

##### Assessment of spasticity

- Further studies were undertaken using cannabinoid knockout mice, including  $\text{CB}_1$ ,  $\text{CB}_2$ , VR-1, FAAH and conditional  $\text{CB}_1$  knockout mice. Spasticity may be induced in ABH (significant spasticity occurs in 50-60% of animals in 80 days after 3-4 disease
- 30 episodes<sup>1</sup>) or ABH. $\text{CB}_1$  -/- (significant spasticity occurs in 80-100% of animals in 30-40 days after 1-2 disease episodes). Compounds are injected initially intravenously (to limit first pass effects), i.p. or orally. Spasticity is assessed ( $n=6-7/\text{group}$ ) by resistance

to hindlimb flexion using a strain gauge [Baker, D. *et al*, *Nature* 2000, 404, 84-87]. Animals serve as their own controls and will be analysed in a pairwise fashion. To reduce the number of animals, effort and expense, following a drug-free period (spasticity returns within 24h) these animals receive different doses and or vehicle.

5 Low doses of CB<sub>1</sub> agonists and CNS active CP55,940, as control, are locally (subcutaneous, intra-muscularly) administered into spastic ABH mice and the lack of activity in a contralateral limb analysed [Fox, A. *et al*, *Pain* 2001, 92, 91-100]. Expression of CB<sub>1</sub> in the peripheral nervous system, including dorsal root ganglia, a non-CNS site for CB-mediated nociception can be removed using peripherin-Cre

10 transgenic mouse [Zhou, L. *et al*, *FEBS Lett.* 2002, 523, 68-72]. These conditional KO mice are maintained on the C57BL/6 background. These mice develop EAE following induction with myelin oligodendrocyte glycoprotein residues 35-55 peptide [Amor, S. *et al*, *J. Immunol.* 1994, 153, 4349-4356].

15 *In vivo* evaluation in normal and CREAE mice

A CNS excluded compound provides a tool for examining if a component of a cannabinoid anti-spastic effect is mediated *via* peripheral CB receptors. Compound (16) was examined for CNS effects in normal mice as shown in Figures 2 and 3. At a dose of 1mg/kg no hypothermia or hypomotility was observed. In CREAE mice a marked effect

20 on spasticity was noticed (Figure 4) providing strong evidence that a selective inhibition of spasticity is achievable without producing CNS effects. As stated above there is no established role for peripheral cannabinoid receptors in the control of spasticity, however, spasticity is likely to be a product of nerve damage in the spinal cord, at least in EAE, [Baker, D. *et al*, *FASEB J.* 2001, 15, 300-302; Baker, D. *et al*, *J.*

25 *Neuroimmunol.* 1990, 28, 261-270] and aberrant signals to and from the musculature are likely, at least in part to contribute to the muscle spasms occurring in spasticity.

Various modifications and variations of the described methods of the invention will be apparent to those skilled in the art without departing from the scope and spirit of the

30 invention. Although the invention has been described in connection with specific preferred embodiments, various modifications of the described modes for carrying out

64

the invention which are obvious to those skilled in chemistry or related fields are intended to be within the scope of the following claims.
